

The Road Towards an AI-Native Air Interface (AI-AI) for 6G

Jakob Hoydis

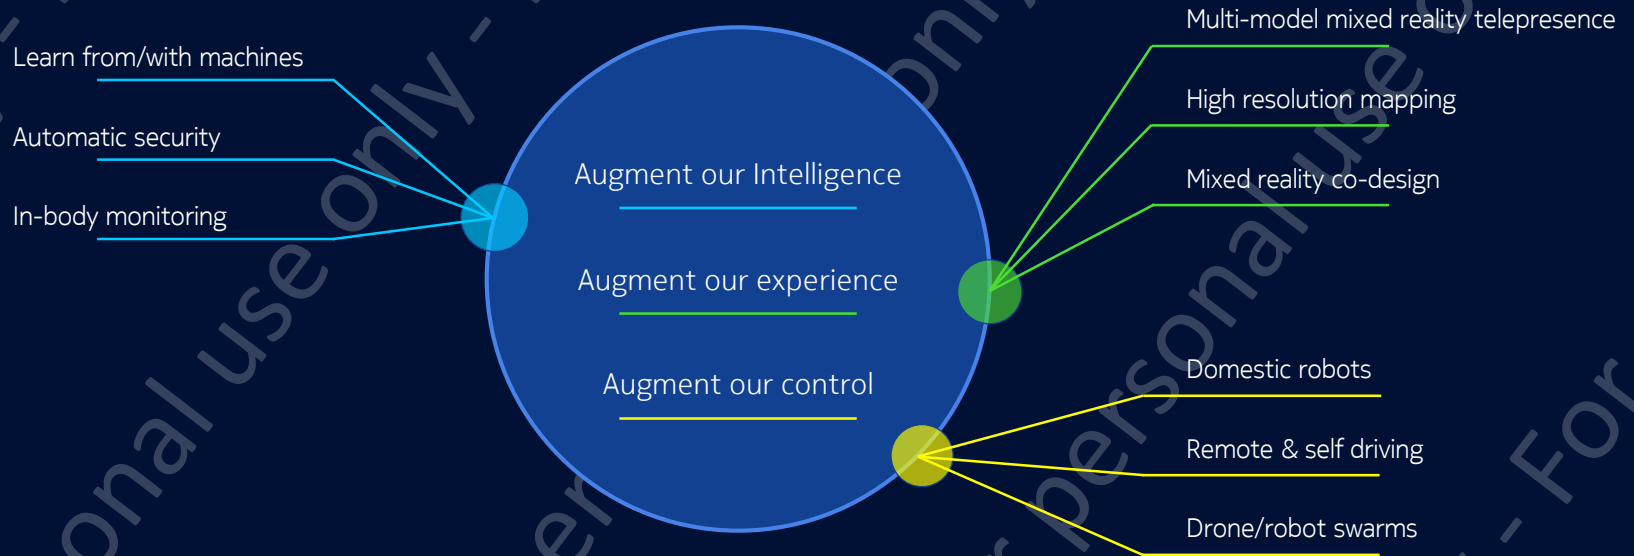

Radio Systems Research & AI

Nokia Bell Labs, France

jakob.hoydis@nokia-bell-labs.com

What will future communications look like in 2030?

Creating the 'augmented human'

6G to enable a new lifestyle at scale

The enabling foundation for that future...

Six key technologies for 6G

AI/ML Air-Interface

New Spectrum Technologies

Network as a sensor

RAN-Core Convergence & Specialization

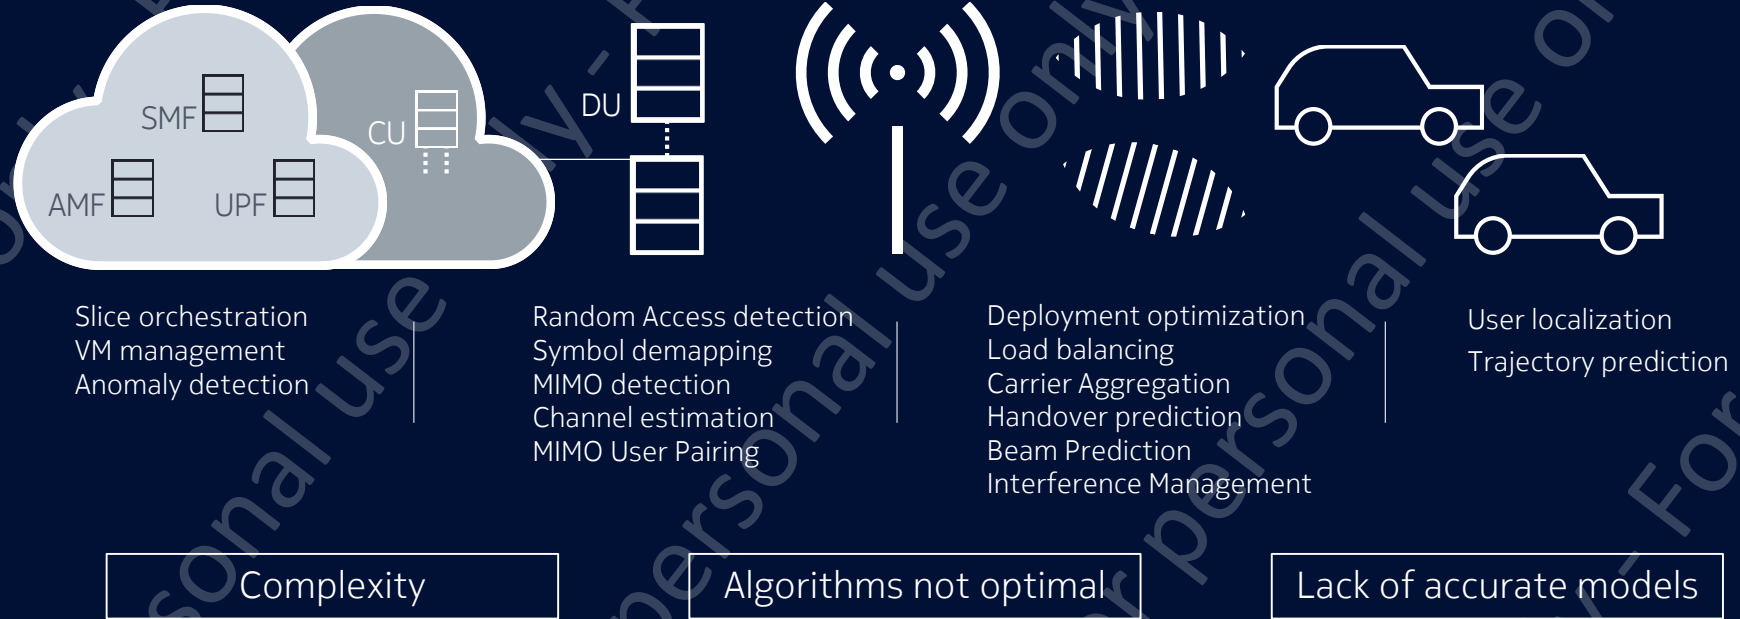

Extreme Connectivity

Security and Trust

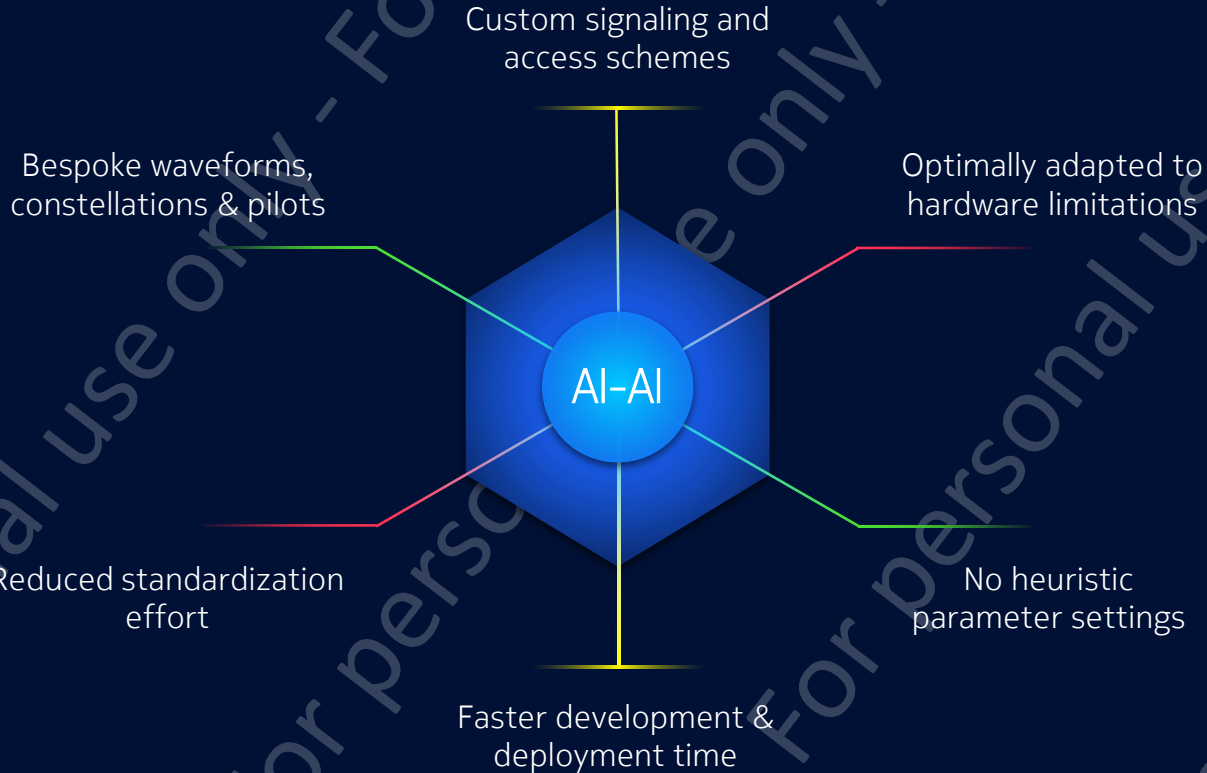

Role of ML for 5G

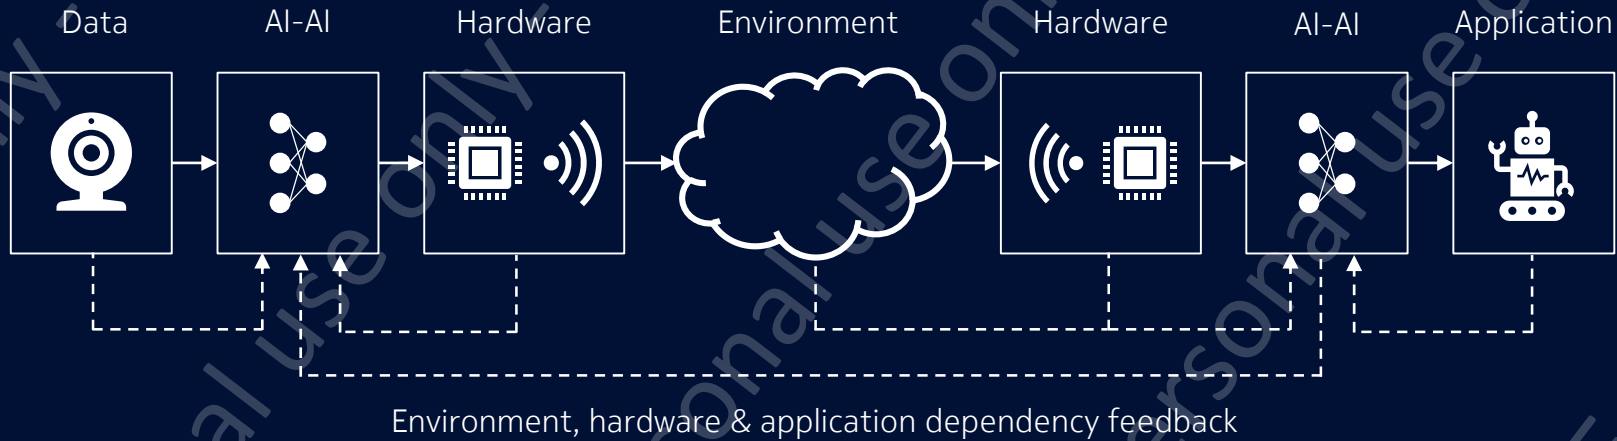

No component of 5G has been designed by ML

What if 6G was built so that ML could optimize parts of the PHY & MAC if needed?

Possible benefits

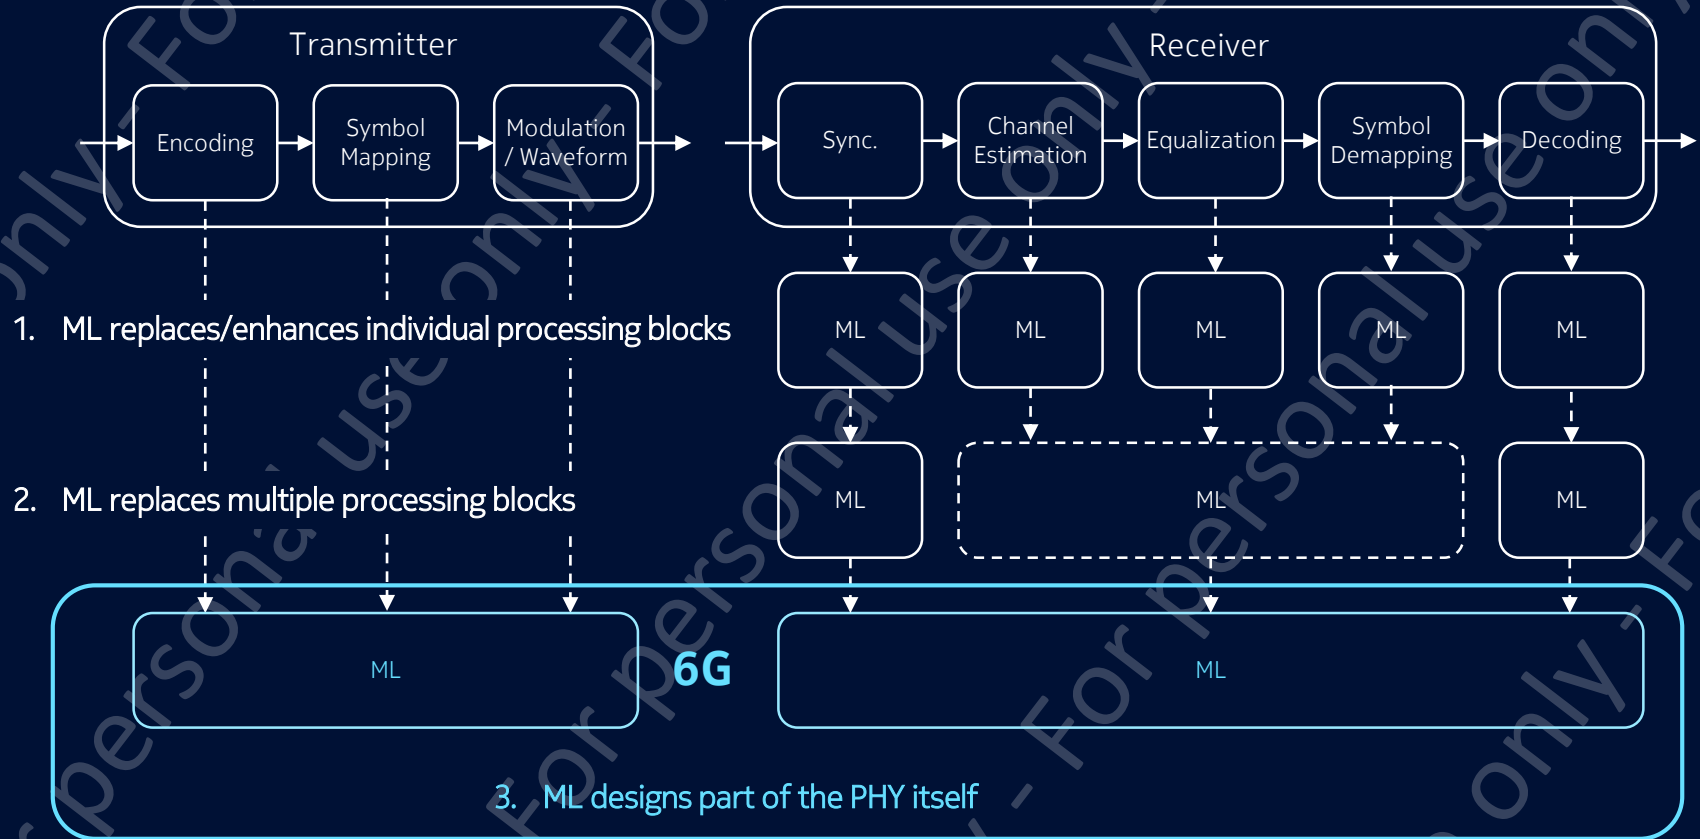

AI-Native Air Interface (AI-AI) for 6G

"Post Shannon": Not about reliably transmitting bits anymore, but rather servicing an application with data in an optimal way

The AI-AI optimally adapts to different environments, hardware, data, and applications

A roadmap to an AI-Native Air Interface for 6G

Case study:
From Neural Receivers to
Pilotless Transmissions

SISO doubly-selective channel

$$\mathbf{Y} = \mathbf{H} \circ \mathbf{X} + \mathbf{N}$$

$$\text{vec}(\mathbf{H}) \sim \mathcal{CN}(0, \mathbf{R}_F \otimes \mathbf{R}_T)$$

Spectral correlation

- $[\mathbf{R}_F]_{i,k} = \sum_{l=1}^L S_l e^{j2\pi\tau_l D_s \Delta_F (i-k)}$
- Subcarrier spacing $\Delta_F = 30$ kHz
- Delay spread $D_s = 100$ ns
- TDL-A power delay profile

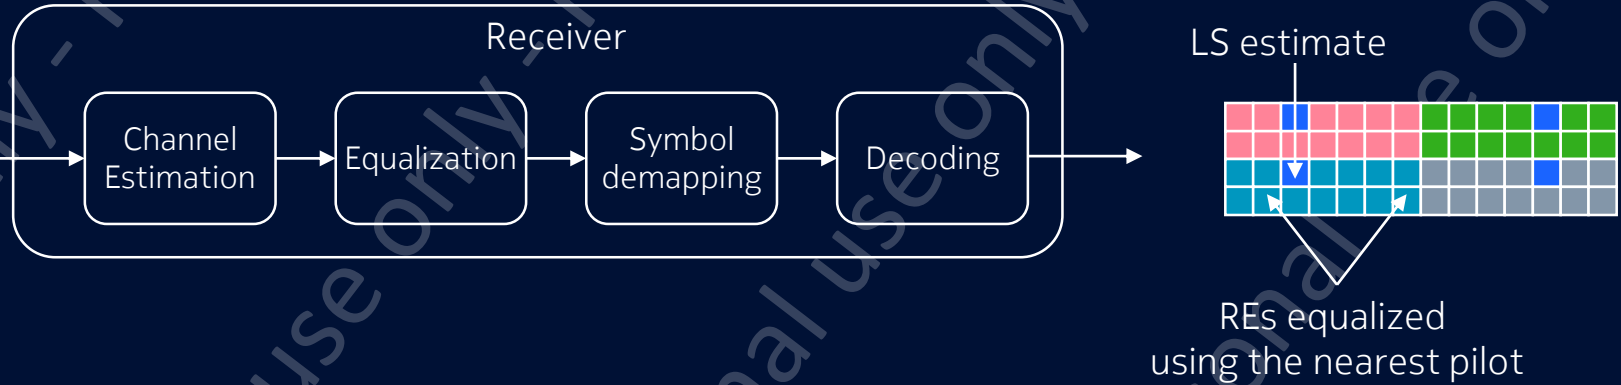

Temporal correlation

- $[\mathbf{R}_T]_{i,k} = J_0 \left(2\pi \frac{v}{c} f_c \Delta_T (i-k) \right)$
- Carrier frequency $f_c = 3.5$ GHz
- Speed $v = 50$ km/h

Modulation & Coding

- 64 QAM
- 5G code $n=1024, r=2/3$

Baseline receiver

- Least-squares channel estimation at pilot positions
- Equalization using the nearest pilot
- Exact LLR computation assuming a Gaussian post-equalized channel
- Textbook sum-product BP decoder with 40 iterations

Potential performance enhancements

Deficits of the baseline

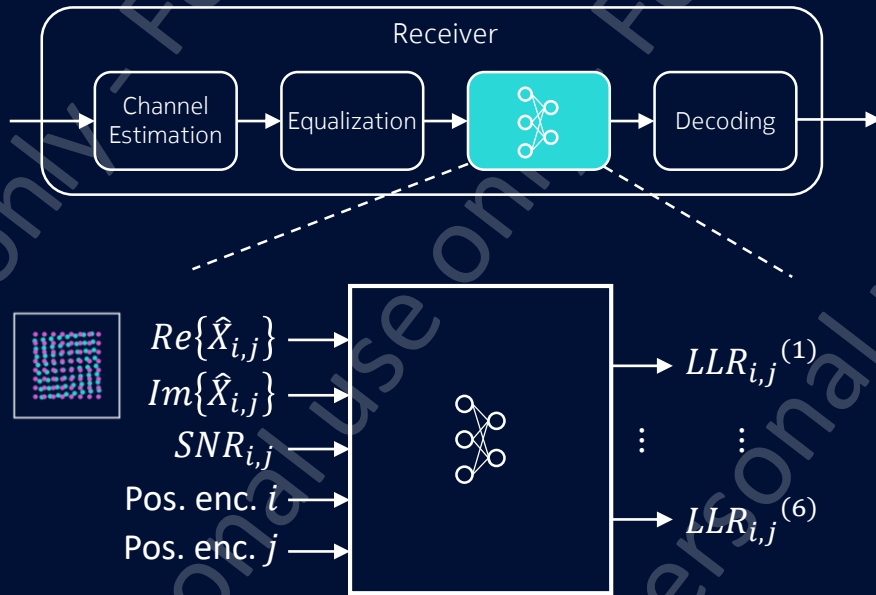

OFDM symbols

Imperfect channel estimation & channel aging lead to

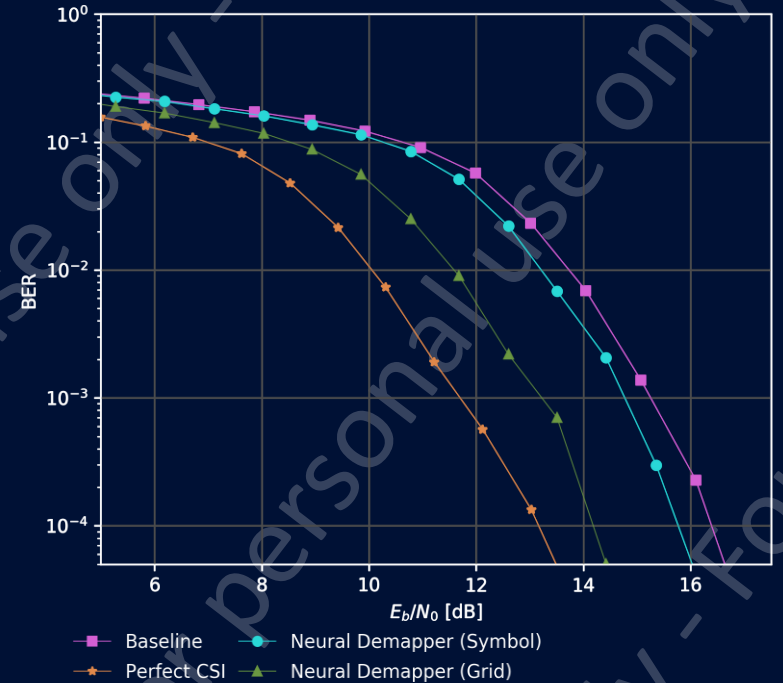

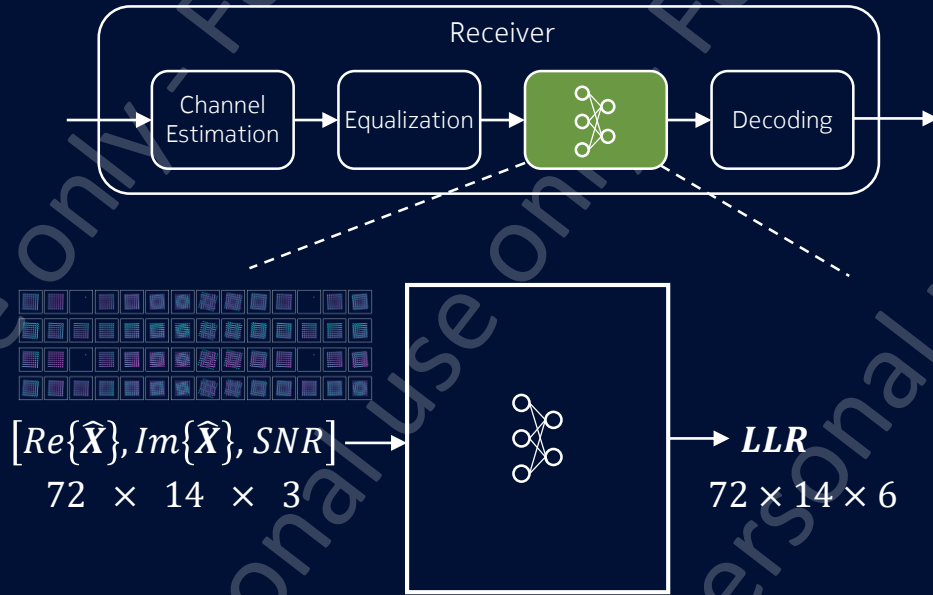

- Mismatched LLR computation
- SNR degradation

Neural demapper (symbol-wise)

Learns grid position-dependent statistics for better LLR computation

Neural demapper (grid-wise)

Leverages pilots and data to compensate for channel aging and mismatched LLR computation

Neural network architecture is key to success

Fully convolutional ResNet

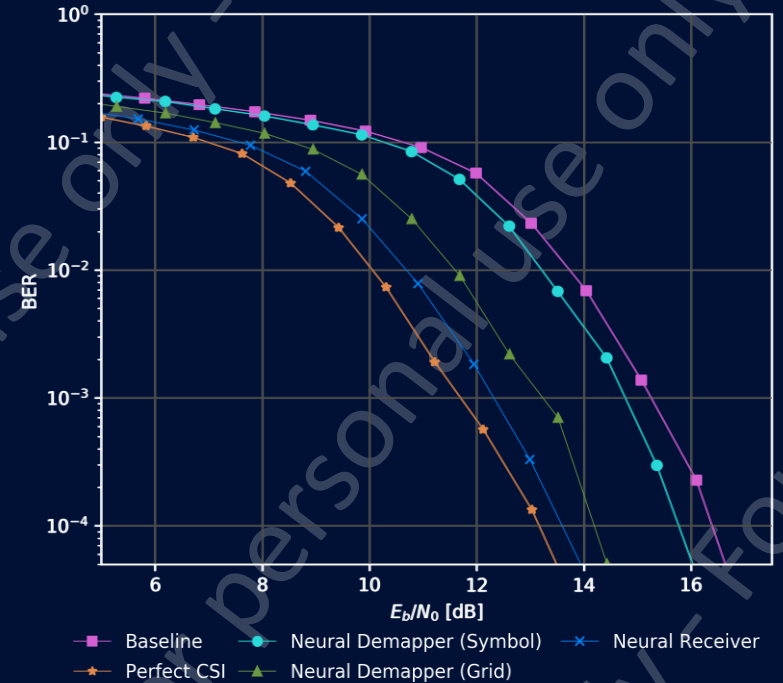

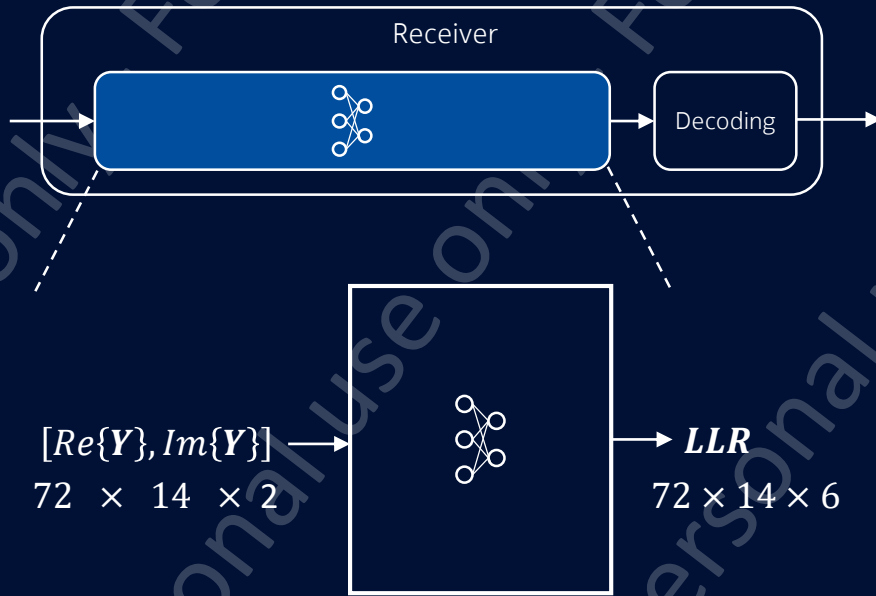

Dilated separable convolutions

M. Honkala, et al., "DeepRX: Fully Convolutional Deep Learning Receiver", arXiv:2005.01494

Each output value has a receptive field spanning the entire resource grid

Neural receiver

Data-aided channel estimation, equalization, and demapping for unprecedented performance

End-to-end learning with Neural receiver

64x2 trainable weights

$$\tilde{c} = \frac{1}{64} \sum_{c \in \tilde{c}} c$$

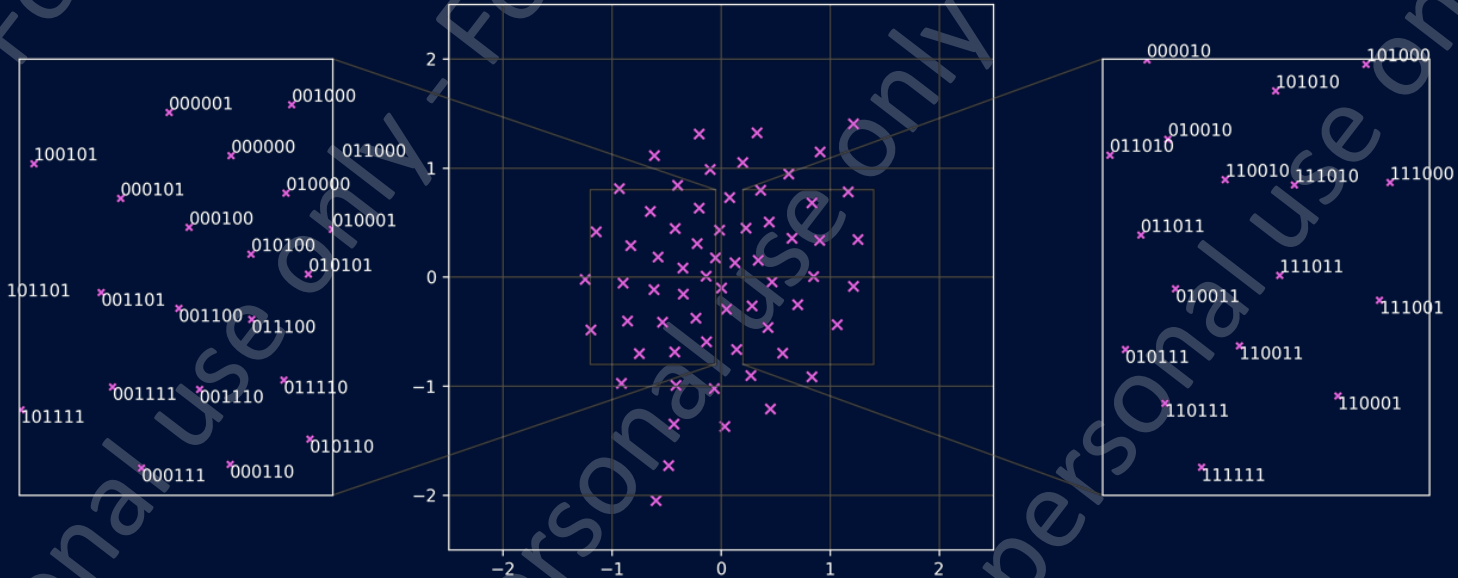

$$c = \frac{\tilde{c}}{\sqrt{\frac{1}{64} \sum_{c \in \tilde{c}} |c|^2 - \left| \frac{1}{64} \sum_{c \in \tilde{c}} c \right|^2}}$$

Zero-mean unit energy constellation

End-to-end learning enables pilotless transmissions without performance loss

Learned constellation for pilotless communication

F. Ait Aoudia, J. Hoydis, "End-to-end Learning for OFDM: From Neural Receivers to Pilotless Communication", arXiv2009.05261

How could this be standardized?

Important research topics for end-to-end learning

- New waveforms for new spectrum
- Learning for systems with (extreme) hardware constraints
- Joined communications + X
- Signals conveying a few bits of information
- Application-specific end-to-end learning
- Semantic communications
- Decentralized & federated learning
- Transfer & meta learning

The next frontier:
Protocol learning

Emerging a RAN protocol

3GPP Way

VS

ML Way

A. Valcarce and J. Hoydis, "Towards joint learning of optimal MAC signaling and wireless access channel access", *arXiv:2007.09948v2*

Can we learn a MAC protocol?

Thank you!
